

# Credit Card Default Prediction Wireframe Documentation

# Home Page

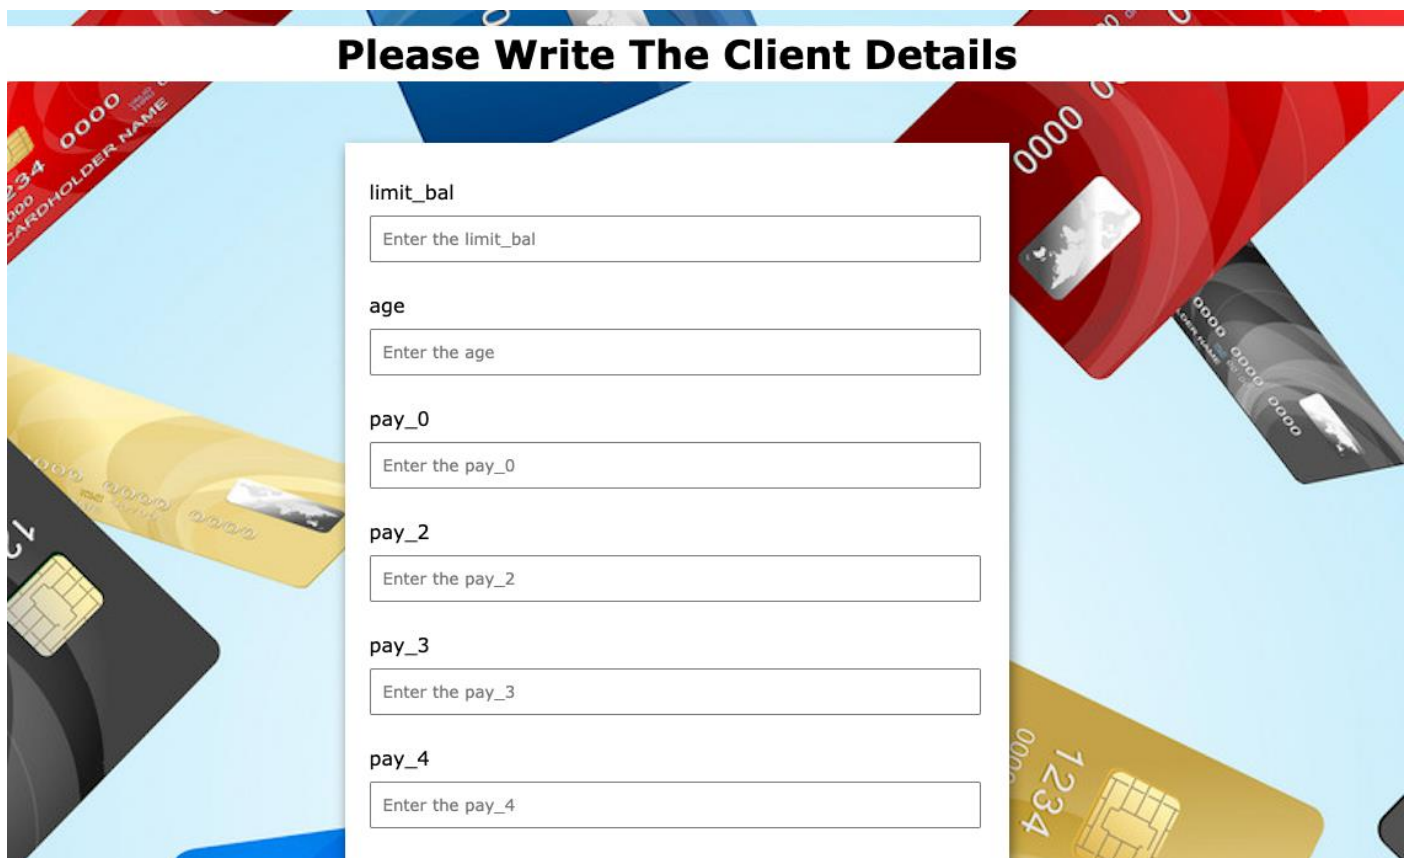

We have divided the “Credit Card Default Prediction System” into Three Sections:

1 . On the first page of our web application we are taking the “**creditCardFault dataset**” in csv format from the user to predict whether the user will “**Default or Not**”.

**2. After successful Upload of the “creditCardFault dataset” then the user will be directed to the next page where they have to enter the Client Details for whom they want to check whether the user will default or not.**

**Please Write The Client Details**

|  |
|--|
| limit_bal  |
| <input type="text" value="Enter the limit_bal"/> |
| age  |
| <input type="text" value="Enter the age"/>       |
| pay_0  |
| <input type="text" value="Enter the pay_0"/>     |
| pay_2  |
| <input type="text" value="Enter the pay_2"/>     |
| pay_3  |
| <input type="text" value="Enter the pay_3"/>     |
| pay_4  |
| <input type="text" value="Enter the pay_4"/>     |

3. After getting the client details we will predict whether the client will **“Default or Not”**.

In the above entered details we will get the prediction that the user will **“DEFAULT”**.
